

Adaptful Tech helps XReps Solve Data Aggregation Challenge

Overview

The XReps mission is to revolutionize the Quarterback training & evaluation process while making top-tier training accessible to QBs everywhere regardless of location, family, and financial situations. This is accomplished via their patent-pending Extended Reality (XR) platform.

The XReps XR platform, immerses players in cognitive drills, simulations, and challenges placing QBs into environments and situations which previously required an organized practice and full team to get meaningful reps. Analytics measure previously unmeasurable performance factors to produce the most comprehensive and effective measure of performance available.

Challenge

XReps needed to get data from VR Headsets into an AWS cloud environment. Once the data was uploaded it needed to be in a usable format for coaches and quarterbacks to understand their performance. XReps measures over a dozen data points for every play the quarterback runs which is a lot of data to aggregate, process and understand quickly.

Solution

Adaptful Tech went through their thorough discovery process to understand the challenge XReps was facing. The next step was to develop a scope of work. Through their agile process they developed a dashboard to aggregate all of the quarterback performance data in an understandable format for coaches and players to use to improve their performance.

Customer Quote –

“Adaptful was amazing to work with from the start to finish of our project. They were very responsive and engaged throughout the experience and we were very pleased with the dashboard they delivered. We now have a trusted software development partner we will use for years to come.”
